Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@lsb-sib.ch).
                                                                                                                                                                                                                                                                                                         Windl O., Dempster M., Estibeiro P., Lathe R.;
Submitted (MAY-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THE FUNCTION OF PRP IS NOT KNOWN. PRP IS ENCODED IN THE HOST GENOME AND IS EXPRESSED BOTH IN NORMAL AND INFECTED CELLS.
-!- SUBUNIT: PRP HAS A TENDENCY TO AGGREGATE YIELDING POLYMERS CALLED "RODS".
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -:- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.
-:- DISEASE: PRP IS FOUND IN HIGH QUANTITY IN THE BRAIN OF HUMANS AND
ANIMALS INFECTED WITH THE DEGENERATIVE NEUROLOGICAL DISEASES KURU,
CREUTZFELDT-JAKOB DISEASE (CJD), GERSTMANN-STRAUSSLER SYNDROME
(GSS), SCRAPIE, BOVINE SPONGIFORM ENCEPHALOPATHY (BSE),
TRANSMISSIBLE MINK ENCEPHALOPATHY (TME), ETC.
-:- SIMILARITY: BELONGS TO THE PRION FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                      Trichosurus vulpecula (Brush-tailed possum).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-87041508; PubMed-3464974; MEDLINE-87041508; PubMed-3464974; Baritten R.J., Davidson E.H.; Gao B., Klein L.E., Baritten R.J., Davidson E.H.; Sequence of mRNA coding for bindin, a species-specific sea urchin sperm protein required for fertilization."; Proc. Natl. Acad. Sci. U.S.A. 83:8634-8638 (1986).

1- FUNCTION: SPECIES-SPECIFIC SEA URCHIN SPERM PROTEIN REQUIRED FOR ADHESION OF SPERM TO THE EGG SURFACE DURING FERTILIZATION BINDIN COATS THE ACROSOME PROCESS AFTER IT IS EXTERNALIZED BY THE ACROSOME REACTION. IT BINDS TO SULFATED, FUCOSE-CONTAINING POLYSACCHARIDES ON THE VITELLINE LAYER RECEPPIOR PROTEOGLYCANS WHICH COVER THE EGG PLASMA MEMBRANE.

1- SUBCELLULAR LOCATION: MAJOR PROTEIN COMPONENT OF THE LUMEN OF THE

-1-SUBUNIT: HETDERCTETRAMER OF TWO TYPE I AND TWO TYPE II KERATINS.
-1-TISSUE SPECIFICITY: EXPRESSED IN THE TERMINALLY DIFFERENTIATED
EPIDERMIS OF PALMS AND SOLES.
-1-DISBASE: DEFECTS IN KRT9 ARE A CAUSE OF EPIDERMOLYTIC PALMOPLANTAR KERATODERMA (EPPK), AN AUTOSOMAL DOMINANT DISEASE CHARACTERIZED BY DIFFUSE THICKENING OF THE EPIDERMIS ON THE ENTIRE SURFACE OF PALMS AND SOLES.
-1-MISCELLANBOUS: THERE ARE TWO TYPES OF CYTOSKELETAL AND MICROFIBRILLAR KERATIN: 1 (ACIDIC; 40-55 kDa) [K9 TO K20] AND II (NEUTRAL TO BASIC; 56-70 kDa) [K1 TO K8].
-1-SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
-1-CAUTION: WAS ORIGINALLY (REF.2) THOUGHT TO BE A 60 kDa CHAIN OF
                                                                                Covello S.P., Irvine A.D., McKenna K.E., Munro C.S., Nevin N.C., Smith F.J.D., Ultto U., McLean W.H.I.;
"Mutations in keratin K9 in kindreds with epidermolytic palmoplantar keratoderma and epidemiology in Northern Ireland.";
J. Invest. Dermaiol, 111:1207-1209 (1998).
-i- FUNCTION: MAX SERVE AN IMPORTANT SPECIAL FUNCTION EITHER IN THE MATURE PALMAR AND PLANTAR SKIN TISSUE OR IN THE MORPHOGENIC

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Isolated nucleic acids and polypeptides, useful for preventing

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to sytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopolasis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; primer; detection; diagnosis; antisense therapy; gene therapy.

```

The present invention describes primer sets for synthesising 5602

```
full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the comprises at least 15 nucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence, where the polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 1'-end sequence, where the complementary to a sequence for sequence 3'-end sequence 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the cDNAs are asiny without any specialised methods. AAH1363 and AAH13633 to AAH13633 to AAH13634 to AAH13634 to AAH13631 to AAH13632 to AAH13639 represent human annho acid sequences; and AAH13639 to AAH13631 to represent pulmers all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The colymnelectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce data for the involving necessary in the printed and nagnostic amino acid sequences ABGONOID-ABG30377 represent novel human call sequence data for this patent did not appear in the printed a specification, but was obtained in electronic format directly from WIPO

polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gane mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving cuantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inapping of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human canno acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed and other types of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AA013910) that exhibit activity elating to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                    production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, infinibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.w1po.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; SEQ ID NO 17385; 21pp + Sequence Listing; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 633;

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sires expressing (II). (I) and (II) are useful in medical clisorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genefic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human and manno manno acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; bromine group domain 11; cancer; haemopathy; HIV infection;
                                                                                                                                                           New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   22; Length 62;
                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polynucleotide (I) and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comprising a sulphate permease for sulphate uptake across the cellular membrane. This controls the flux of S-containing beta lactam precursors an expression cassette containing the polynucleotide operably linked to regulatory sequence can be used to transform a beta lactam producing organism. Transformed cells show an increased production of the beta lactam compound: This is used in the control of the regulation and expression level of sulphate transporters, in order to influence the production level of penicillin and other beta lactams.
                                                                                                                                                                                                                                                                                                                                                        Driessen AJM, Turner G;

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their
                                                                                         New human bromo group domain 11 for diagnosing and treating malignant tumor, hemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations
                                                                                                                                                                                                      The present invention provides the protein and coding sequences of humz bromine group domain 11. The sequences can be used in the treatment of cancer, haemopathy, HIV infection, immunological diseases and inflammation. The present sequence is the protein of the invention.

activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the examplification of the present invention.

N. B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,

The specification describes human secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene. The amount of the polypeptides in a sample or by determining the amount of the polynucleotides. Specific uses are described for each of mutations in the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly carpressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, cliseases of the immune system, autoimmune diseases, hepatic and renal diseases of the immune system, alteringies, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, prostate diseases, obesity, malignancies, diseases of testes, lung or thymus, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                   New isolated human genes and the secreted polypeptides they encode
  Olsen Young

New isolated Borrelia burgdorferi nucleic acids - used to develop

This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus. products for the diagnosis, prevention and treatment of diseases caused by Borrelia, particularly Lyme disease Claim 12; Page 75; 275pp; English.

A;Title: Characterization of the complete RhPV 1 genomic sequence and an integration A;Reference number: A38503; MUID:91135018
A;Accession: A38503; MUID:91135018
A;Accession: A38503
A;Status: translation not shown
A;Residues: 1-191 cOstry
A;Coss-references: EMBL:M37717
C;Superfamly: papillomavirus E6 protein
C;Keywords: DNA binding; early protein; transforming protein; zinc finger
F;60-96/Region: zinc finger CCCC motif
F;133-169/Region: zinc finger CCCC motif

```
Gigge Protein (91pE) homolog - Lyme disease spirochete

C: Species: Borrelia burgdorferi (Lyme disease spirochete)

C: Species: Borrelia burgdorferi (Lyme disease spirochete)

C: Species: Borrelia burgdorferi (Lyme disease spirochete)

C: Date: 13-Feb-1998 #sequence_revision 13-Feb-1998 #text_change 08-Oct-1999

C; Accession: H70101

                                                                                                                                                                                                                                                                                                                                                 AC2349

AC2349

Appothetical protein alr4346 [imported] - Anabaena sp. (strain PCC 7120)

Appothetical protein alr4346 [imported] - Anabaena sp. (strain PCC 7120)

A; Species: Anabaena sp. (strain PCC 7120) is a synonym of Nostoc sp. strain PCC 7120

C; Date: 14-Dec-2001 #sequence_revision 14-Dec-2001 #text_change 11-Jan-2002

C; Accession: AC3349

SUBUNIT: THE 26S PROTEASONE IS COMPOSED OF A CORE PROTEASE, KNOWN AS THE 20S PROTEASONE, CAPPED AT ONE OR BOTH ENDS BY THE 19S REGULATORY COMPLEX (RC). THE RC IS COMPOSED OF AT LEAST 18 DIFFERENT SUBUNITS IN TWO SUBCOMPLEXES, THE BASE AND THE LID, WHICH FORM THE PORTIONS PROXIMAL AND DISTAL TO THE 20S PROTEOLYTIC CORE, RESPECTIVELY (BY SIMILARITY).

SIMILARITY: BELONGS TO THE PROTEASOME SUBUNIT S3 FAMILY.
